The index of refraction can be varied by electrical
means to such an extent in electrochemical boundary
layers of suitable solutions that in a large sector total
reflection of light can be produced on such a boundary
layer. The optical effects of the boundary layer in the
case of total reflection are discussed after the calcu-

It was established that aromatic hydrocarbons can be
alkylated and aliphatic-aromatics dealkylated in the
gaseous phase over aluminosilicate catalysts. Mo-
bility of the alkyl groups is brought about by these
catalysts which makes double decomposition of the
hydrocarbons possible. Considerations are presented
pertaining to the possible mechanism of catalytic con-
densation of hydrocarbons. (Author)
